

Precision sawing

Precision cut-outs are possible at any time. You can even saw hand-held sections precisely and with minimal vibrations.

Fine sanding

Removing paint and giving surfaces a final sanding down - the triangular shape of the sanding pad means you will be able to reach into every corner and angle.

High speed cutting

Cutting plasterboard to shape and producing cut-outs is achieved with high cutting speed, yet with significantly less dust generation than is the case with other saws.

Adjusting door jambs

Door jambs can now be precisely trimmed with the E-Cut saw blades, because the cropped shaped enables you to work flush to surfaces.

Deep Notching

The long E-Cut saw blades can be used to cut deep notches and grooves. Just like with a mortise chisel, you can plunge straight into the material.
